Daniel Olliver

Full-Stack Developer · Auckland, New Zealand
daniel@danielolliver.com · danielolliver.com/dev · github.com/dwatces · linkedin.com/in/danielolliver · 021 069 9543

PROFILE

Full-stack developer with five years building and shipping production web applications for real users. Strongest in React, TypeScript and Next.js on the front end, with Node, Express and Supabase/PostgreSQL behind it — comfortable owning a feature from design through to deployment in a small, fast-moving team. Cares about the details that decide whether a product feels good to use: responsive layouts, component architecture, performance and accessibility. Postgraduate Certificate in AI from the University of Auckland; builds daily with modern AI tooling.

TECHNICAL SKILLS

Front-End	React, TypeScript, Next.js, JavaScript (ES6+), Vite, responsive & mobile-first design, component architecture, accessibility, Core Web Vitals & performance
Back-End & Data	Node.js, Express, REST API design, Supabase (PostgreSQL), MongoDB, Stripe, third-party API integration
Platforms & Tooling	Vercel, AWS, Cloudways, WordPress (themes, hosting, DNS, GA4/GTM), Webflow, Anthropic SDK, Claude Code CLI (agent pipelines, hooks, memory)
Practice	Git, Jira, Postman, Agile & sprint cycles, code review, analytics & experimentation

EXPERIENCE

Founder & Full-Stack Developer
2024 – Present

Olliver Web · olliverweb.co.nz · Auckland, NZ

Independent practice delivering production applications and websites for clients across health, tourism and e-commerce in New Zealand and the UK — scoping, build, deployment and ongoing maintenance. Practice site scores 100/100 on Lighthouse performance, accessibility, SEO and best practices.

- Designed and built an **ADHD patient-assessment platform** for a UK health provider on a three-month contract — React front end, Node/Express API, Supabase (PostgreSQL) for patient data. Built a multi-step assessment flow used by patients on mobile, with saved progress, validation and clear error states, deployed to production under strict reliability requirements.
- Migrated **backtonaturetours.co.nz** (Dunedin tour operator) to a client-editable Webflow CMS — native and CMS builds for Tours and Testimonials, FareHarbor booking integration, and an SEO migration that kept or redirected most of the old page addresses, with structured data. Case study: olliverweb.co.nz/work/back-to-nature-tours
- Integrated **Stripe payment flows** and Facebook Ads pixels across multiple e-commerce projects; built form-to-CRM pipelines and implemented GA4/GTM analytics to measure and improve conversion.
- Write and publish technical guides and project case studies for non-technical business owners — eight to date, covering build costs, platform trade-offs and SEO.

Developer (contract → permanent)
Feb 2022 – Jan 2024

3PM · Auckland, NZ

- Delivered a **React/Node.js resource-scheduling platform** for construction trades on a three-month contract; performance on the build led to a permanent full-time offer.
- Built and maintained production MERN applications in an Agile team, contributing across sprint cycles, code reviews and cross-functional work with stakeholders.

Graduate Teaching Assistant
Mar – Jun 2024

University of Auckland

- Supported COMPSCI 719 (Programming with Web Technologies) through tutorials and one-on-one mentoring across HTML, CSS, JavaScript, server-side frameworks and database fundamentals.
- Translated complex concepts clearly for students at widely varying technical levels, under time pressure.

Full-Stack Developer Intern & Scrum Master
Mar – Nov 2021

OutPace · Auckland, NZ

Designed and built a responsive full-stack application working directly with company directors; led standups, retrospectives and weekly demos to keep delivery consistent against stakeholder expectations.

PROJECTS & RESEARCH

Geometric ML and quantum computing research — Independent research, 2025–26: more than two dozen controlled experiments under one rule, no result written down before its run completes. Showed that hexagonal wiring does not help a network learn, while 6-fold symmetry tying does help when data is scarce; reproduced anyon braiding on three IBM quantum processors. Essay: danielolliver.com/essay · demo: danielolliver.com/anyons

AI-powered review tool — React/Vite and Node/Express application using the Anthropic multimodal API to analyse uploaded images alongside reviewer comments before generating responses. Includes tone control, edit-before-accept flow and regeneration. github.com/dwatces/ai-powered-comments-challenge

Eon — Brand and storefront site for a New Zealand candle label, built in Next.js and deployed on Vercel. Live: eon-ht82.vercel.app · github.com/dwatces/Eon

EDUCATION

Postgraduate Certificate in Artificial Intelligence · University of Auckland · 2024
Computational intelligence, machine-learning architecture and AI systems; independent research into novel neural-network architectures.

BSc in Computer Science · Auckland University of Technology · 2021
